Check Print Comparison: Before vs After Fix

Demonstrating the batch print format fix for CheckPrint application

❌ BEFORE: Simplified HTML (Wrong)

Batch print used generateCheckHtml() - simplified version

⚠️ Issues with this approach:

- Hardcoded positioning - doesn't match custom templates
- Missing MICR banking font
- No check stubs (payee/bank copies)
- No drawing elements (lines, boxes)
- Wrong page sizing and margins
- Doesn't respect preprinted check settings
- Different from single print output

✅ New

📝 Summary of Fix

Root Cause: The `batchPrintUnprinted()` function was calling `generateCheckHtml()` which created a simplified HTML version with hardcoded styling. Single print used the actual DOM template with proper rendering.

Solution: Created `generatePrintableCheckHtml()` that applies the same template logic as single print, ensuring identical output for both batch and single printing.

Result: Batch printing now produces checks that are pixel-perfect matches to single print, with proper templates, MICR line, stubs, and all formatting.

Additional Improvements

- **Error Handling:** Print window opens synchronously before database operations to prevent iOS Safari popup blocking
- **User Feedback:** Clear error messages shown when printing fails or popup is blocked
- **Approval Workflow:** Pending checks now show status badges, with Approve/Reject buttons for approvers and admins

- **Smart Batch Printing:** Batch print now skips pending checks instead of disabling entirely, printing only approved checks
